Welding positions
CARBODUR WZ 51 B is a basic electrode with $140 \%$ recovery. It deposits a wear resistant alloy and can be applied to reclaim hot-forging dies and to overlay the edges and flat areas of low alloyed high density steel tools.

The preheat and interphase temperatures should be held at about $300^{\circ} \mathrm{C}$ depending on the base metal and its heat abduction. Normally, the higher temperature range should be chosen. Heat induction during low tension welding should be continually monitored.
Slow cooling is recommended using sand or oven methods.
